

COMPUTER PROGRAMMING

LAB 3

LAB TITLE

Relational Operators, Logical Operators and Conditional Statements in C++

1. Objective

- The objective of this lab is to understand how relational operators, logical operators, and conditional statements work in C++. We learn how to compare values and make decisions in a program using if, if-else, and else-if statements.

2. Theory

- In C++, programs normally run step by step. Sometimes we need the program to make decisions based on conditions. For this purpose, C++ uses relational operators, logical operators, and conditional statements.
- Relational operators compare two values such as <, >, ==, and !=.
- Logical operators combine conditions such as && (AND), || (OR), and ! (NOT).
- Conditional statements like if, if-else, and else-if help the program execute different actions depending on the condition.

3. Software

- DEV-C++ IDE
- C++ Compiler

Conclusion

- In this lab, we learned how to use relational and logical operators and how conditional statements help a program make decisions. These concepts are important for writing logical programs in C++.
